# University Application Funnel Analysis

## Project Overview

This project analyzes the university admissions funnel using applicant-level data across multiple programs and stages.

The goal is to:

- Identify bottlenecks in the admissions pipeline
- Measure enrollment efficiency
- Quantify revenue realization
- Detect leakage between stages
- Provide actionable recommendations to improve yield and revenue

The analysis focuses on improving Offer-to-Enrollment conversion, revenue capture, and admissions productivity.

## Dataset Summary

- **Rows:** 2000
- **Columns:** (Application ID, Program, Status, Fee Status, Offer Status, Enrollment Status, Revenue, etc.)
- **Key Funnel Stages Identified:**
    - Applications Received
    - Offers Made (Conditional / Unconditional)
    - Accepted Offers
    - Enrolled
    - Withdrawn / Declined

### Key Funnel Variables Used

- Offer Type (Conditional / Unconditional)
- Enrollment Status
- Withdrawal Status

- Revenue Collected
- Program / Department
- Intake Year

# Exploratory Data Analysis (EDA)

### Data Preparation

- Standardized status labels (e.g., Offer Accepted, Enrolled, Withdrawn)
- Derived calculated fields:
    - Admissions
    - Offer-to-Enrollment Rate
    - Revenue Realization %
    - Pipeline Leakage %
- Removed inconsistent intake references
- Validated revenue consistency against enrolled students

# Funnel & Enrollment Efficiency Analysis

### Total Applications vs Admissions

- Total Applications = X
- Total Admissions (Enrolled) = Y
- Overall Conversion Rate = (Admissions / Applications) × 100

### Offer Analysis

- Total Offers Issued = A
    - Conditional Offers = B
    - Unconditional Offers = C
- Offer Acceptance Rate = (Accepted / Offers Issued) × 100
- Offer-to-Enrollment Rate = (Enrolled / Offers Issued) × 100

### Pipeline Leakage %

Measures drop-off between stages

**Stage-level leakage**:

- Application → Offer
- Offer → Acceptance
- Acceptance → Enrollment

Identifies major bottlenecks.

## Withdrawn Applicants

- Total Withdrawn = W
- % Withdrawn from Accepted Offers = (Withdrawn / Accepted) × 100

High withdrawal rate indicates:

- Financial barriers
- Visa issues
- Competitor conversion

## Revenue Realization %

$$\text{Revenue Realization \%} = \frac{\text{Actual Revenue Collected}}{\text{Potential Revenue from Offers}} \times 100$$

Where:

- Potential Revenue = Offers × Avg Tuition
- Actual Revenue = Enrolled × Avg Tuition

This measures **financial efficiency of the funnel.**

## Program-Level Efficiency

For each program:

- Applications
- Offers
- Enrollments
- Offer-to-Enrollment Rate
- Revenue Contribution
- Leakage %

Used to identify:

- High-volume / low-yield programs
- High-yield / high-revenue programs
- Underperforming departments

# Business Recommendations

- **Improve Offer Quality:** Increase unconditional offers and strengthen academic pre-screening.
- **Reduce Post-Offer Leakage:** Implement 14-day structured follow-ups and deposit deadline incentives.
- **Optimize Revenue Capture:** Introduce early tuition deposits and pre-approve financial aid for high-value applicants.
- **Program Portfolio Strategy:** Scale high-yield programs and reposition low-yield ones.
- **Enrollment Forecasting:** Use historical Offer-to-Enrollment ratios to predict intake capacity.
